No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A Geneseq 19Jun03:*

                                         A novel multimeric hybrid gene is used as a vaccine. The gene consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza vitus (PIV) and respiratory syncitial vitus (RSV)). The gene sequences that are particularly used are those which encode PIV-3 F and MN proteins (AAQ45683, AAQ45684) and RSV F and (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                     vaccines by inserting the Title way. Figure in the control of alternative signal and expression sequences, for example the chimeric g protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will administered to a host organism the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly resulting in a balanced Thi/Th2 immune response and for raising Ab, by usual immunisation and cell fusion methods.
and
protective vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

                                                                                                                              The sequences of mRNA encoding HRSV structural proteins are given in AAQ2622-26. The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer immunity against respiratory tract infections on human subjects. (Updated on 25-MAR-2003 to correct PF field.)
                                 Vaccines for human respiratory virus - include structural genes coding for native structural viral proteins and immunogenic fragments

The invention relates to a recombinant Sendai virus comprising an exogenous nucleic acid encoding a paramyxovirus (PMV) protein or its antigenic fragment. The virus may be administered in combination with an antiviral chemotherapeutic compound. Two or more viruses expressing different PMV proteins nay be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or cellular immune response to a PMV in a mammal, particularly a human. Further a recombinant Sendai virus comprising an exogenous nucleic acid encoding a second PMV protein is also administered and priming and/or boosting humoral or cellular immune response comprises administering on or more of a recombinant or isolated PMV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral ceffective vaccine against PPIV or RSV (the major causes of paediatric effective vaccine against PPIV or RSV (the major causes of paediatric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               respiratory disease) and also to express any gene of interest in target calls, providing a positive medical impact on impaired cells. Wild-type globin gene transfer (i.e. gene therapy) into stem cells effects a cure for sickle cell disease or betathalassaemia. The recombinant virus may also prove effective in conferring immunity to human immunodeficiency virus (HIV) infection. The Sendai virus replicates at level that is high enough to induce sufficient immunity, but does not cause any harm to human recipient. The present sequence represents a respiratory synoyial virus (RSV) G protein (heavily glycosylated protein), a PMV protein ultable for expression by the recombinant virus of the invention.
                                                                   þ
                                                              Recombinant Sendai virus useful in vaccines to protect infection paramyxoviruses, comprises exogenous nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                              The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein coproduced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G proteins immunoprotective ability. The resulting immunogenic composition will generate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly resulting in a balanced Th/772 immune response and for raising Ab, by usual immunisation and cell fusion methods. This truncated G protein is secreted since it lacks a transmembrane domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 KRIPNKKPGKKTTTKPTKKPTFKTTKKDLKPQTTKPKEVPTTKPTEEPTINTTKTNITTT

                                                                                                                                                                        The specification describes a product which antagonizes binding of respiratory synctial virus (RSV) G-protein to annexin II or Lestectin, or causes a decrease in cell surface levels of annexin II or L-selectin. Such products are used in the manufacture of a medicament for use in prevention or treatment of RSV infection. The present sequence represents a RSV G-protein.

                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a fusion protein comprising a peptide derived from the G protein of Respiratory syncytial virus (RSV) linked to a peptide derived from a diphtheria anatoxin. The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria anatoxin derived peptides, when modified to lack at least one cysteine residue, are useful as carrier peptides. Deletion of Cys residues in peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal infections, or cancers and to generate, or increase, an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Outer membrane protein A; OmpA; P40; enterobacteria; nasal composition; RSV; RSV infection; lung; respiratory tract; vaccine.

The present sequence represents a fusion protein comprising a peptide derived from the G protein of Respiratory syncytial virus (RSV) linked to a peptide derived from a diphtheria anatoxin. The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria residue, are useful as carrier peptides. Deletion of Cys residues in anatoxin peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal infections, or cancers and to generate, or increase, an immune response against infectious agents or tumour cells.

                                                                                                                                                                                                                                                                                                                                                                                                                   7
                                                                                                                                                                           The present sequence represents a fusion protein comprising a Klebsiella pneumoniae outer membrane protein A (OmpA) designated P40 and a respiratory syncytial virus (R8V) antigen. Enterobacterium OmpA proteins, a ssociated with an immunogenic peptide from R8V are used to prepare a nasal composition that induces a protective response, against R8V infection in the upper and lower (lung) respiratory tract. OmpA potentiates the immune response to some immunogenic peptides, eliminating the need for adjuvants. The method is useful for producing vaccines for prevention or treatment of R8V infections.

to a peptide derived from a diphtheria anatoxin. The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria anatoxin derived peptides, when modified to lack at least one cysteine residue, are useful as carrier peptides. Deletion of Cys residues in anatoxin peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal infections, or cancers and to generate, or increase, an immune response against infectious agents or tumour cells.

The BB fragment is able to bind to human serum albumin and thereby enhance immunogenicity of any antigen, hapten or immunogen that is covalently coupled to it. In this specific example, the BB fragment was found to induce T helper memory cells, leading to production of anti-G2A antibodies by stimulated

The specification describes a method which uses quaternary aliphatic ammonium salts together with an immunogen or antigen to treat syncytial virus infections. The combination of the salt with the antigen or immunogen improves immunogenicity and equilibrates the Th1/Th2 immune response. The method is used for the treatment of respiratory syncytial virus infections. The present sequence represents a fusion protein, comprising an albumin binding domain of the G protein of Streptococcus sp. fused to a G protein fragment of respiratory syncytial virus (VRS, long version). The fusion protein is used as an antigen in the method of the invention. Claim 16; Page 22-23; 35pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              409
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                440 AAGATCTCAAACCTCAAACCACTAAACCAAAGGAAGTACCCACCACCAAGCCCACAAGAAG 499
             Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-ena.fr)
Determination of this BAC-ena sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gosegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Rosewell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's pl and EST library is more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://www.from.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA linear GSS 03-JUN-1999 survey sequence TET3 end of BAC # com Drosophila melanogaster (fruit

Submitted (02-JUN-1999) Genoscope - Centre National de Sequencage :
BP 191 191066 EWRY cedex - FRANCE (B-mail : seqref@genoscope.cns.fr
- Web : www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of
collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila
melanogaster genome using these BAGs. For further information
please see http://www.fruitfly.org The BDGP Drosophila
melanogaster BAC library was prepared by Kazutcyo Osoegawa and
Aaron Mammoser in Pieter de Jong's laboratory in the Department of
Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,
NY. The library is named RPCI-98 and was constructed by partial
BCORI digestion of Drosophila DNA provided by the BDGP from the
isogenic strain y2, cn bw sp, the ame strain used for the BDGP's
Pl and EST libraries. A more detailed description of the library
and how to order individual BAC clones, the entire library, or
filters for hybridization from the BACRAC Resource Center can be
found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                        Drosophila melanogaster genome survey sequence TET3 end of BAC:
BACR3219 of RPCI-98 library from Drosophila melanogaster (fruit AL071370.

http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                312

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruiffy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2, cn bw sp, the same strain used for the BDGP's PI and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
                                                                                                               Sequence 4304, Application US/09878574

Sequence 4304, Application US/09878574

Patent No. US20020110548A1

GENERAL INFORMATION:

APPLICANT: Byrum, Joseph R.

APPLICANT: La Rosa, Thomas J.

APPLICANT: Thompson, Michael D.

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated with

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated with

TITLE OF INVENTION: Number: 0209/878,574

CURRENT APPLICATION NUMBER: US/09/878,574

CURRENT PELICATION NUMBER: 09333,535

PRIOR FILING DATE: 1990-06-14

NUMBER OF SEQ ID NOS: 15775

LENGTH: 793
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AATTACATCACAAAC-CACCACCATACTAGCTTCAACAACACCAGGAGTCAAGTCAAACC 178

APPLICANT: Tao, Nengbing

APPLICANT: Mathialagan, Nagappan

TITLE OF INVENTION: NUCLEIC ACID AND OTHER MOLECULES ASSOCIATED WITH LACTATION AND

FILLE OF INVENTION: WINSCILE AND FAT DEPOSITION

FILLE OF INVENTION: WINSCILE AND FAT DEPOSITION

FILLE OF INVENTION: UNBER: US/09/983, 965

CURRENT APPLICATION NUMBER: US 99/465,231

PRIOR FILING DATE: 1999-12-15

PRIOR FILING DATE: 1999-12-17

NUMBER OF SEQ ID NOS: 5912

FEACULE OF SEQ ID NOS: 5912
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        178

Sequence 4312, Application US/09878574

Batent No. US20020110548A1

GENERAL INFORMATION:

APPLICANT: La Rosa, Thomas J.

APPLICANT: La Rosa, Thomas J.

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated with

TITLE OF INVENTION: Plants

FILE REFERENCE: 38-21(15401)B

CURRENT APPLICATION NUMBER: US/09/878,574

CURRENT FILING DATE: 2001-12-21

PRIOR APPLICATION NUMBER: 09/33,535

PRIOR PLING DATE: 1999-06-14

NUMBER OF SEQ ID NOS: 15775
